

Overall Description:
When the weblog owner clicks the invite button, the UIActionInterceptor picks up the click and sends it over to the MembersInvite for processing. Members invite sends the username to the User Manager, which checks the database tables for permission. The user manager sends the status back to the Members Invite, which grants permission to the User Manager. A UI message is then set confirming the permission. Once permission is granted, the invited User gets permission, and an invite is shown on the main menu. When the user clicks accept, the permission is confirmed with the user manager, which passes it on to the database.

Proposed Changes:
On load, the MainMenu will call CheckCoManagers on the User manager to query the database to see who the co-managers are. The result will be sent back to the MainMenu to be displayed.
